ANALYTICAL MANAGEMENT INCIDENT SYSTEM

Operational certainty depends on continuous, reliable intelligence

Why It Matters

When incident information is spread across teams, systems, and reports, teams can lose sight of the full picture.

Decisions take longer, risks surface late, and teams rely too heavily on hindsight.

- Brings scattered incident information together
- Reduces manual interpretation
- Makes emerging risks visible earlier
- Supports stronger governance

How AMIS Changes Decision-Making

AMIS brings incident and operational data together in one place, so teams can see what is happening.

It helps teams understand where attention is needed and what action should come next.

- Connects data across teams
- Highlights trends and anomalies
- Shows where pressure is building
- Supports clearer leadership reporting

What AMIS Delivers

AMIS turns operational data into practical insight that teams can use with confidence.

It helps teams monitor risk, understand performance, and make better-informed decisions.

- Clear visibility across teams and locations
- Predictive insight into emerging risks
- AI-assisted planning support
- Executive insight for governance

Without AMIS: Teams rely on fragmented information and retrospective explanation

With AMIS: Users have a clearer, more timely view of what is happening and what needs attention.

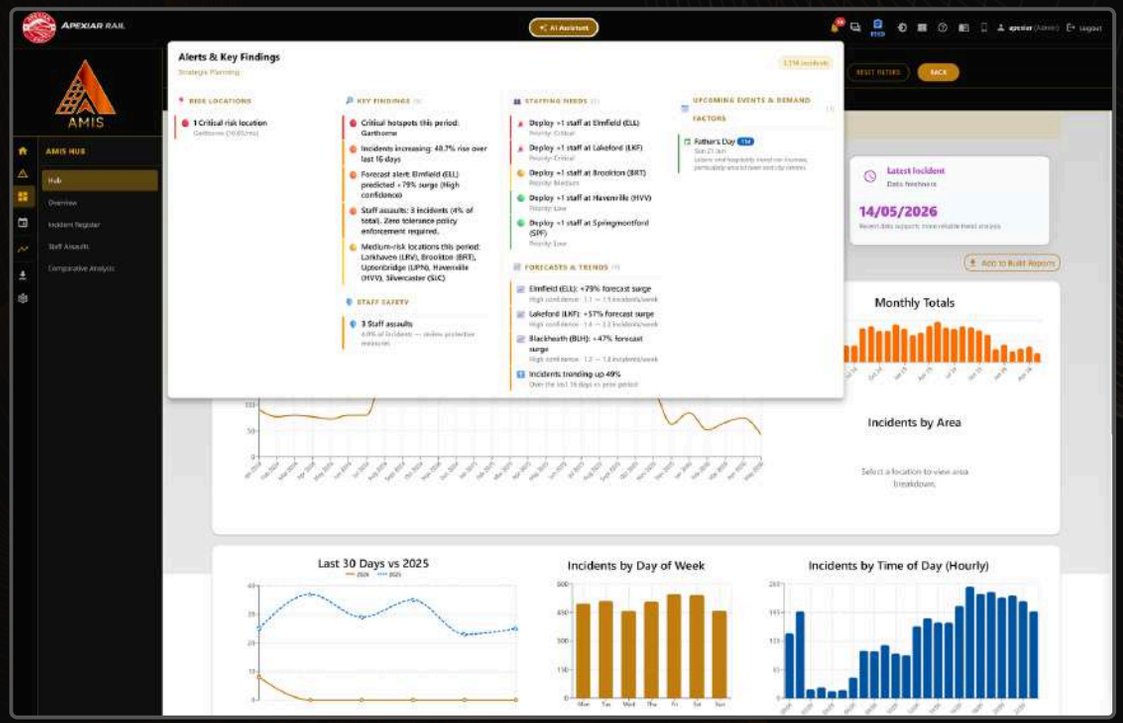

APEXIAR PORTAL (AMIS)

One platform for operational insight, analysis, and action

Overview

AMIS brings reporting, dashboards, analytics, and planning support together in one connected environment. It helps users move away from disconnected tools, manual review, and retrospective reporting by giving teams a clearer view of operational activity.

Designed for complex and regulated environments, AMIS supports analysts, operational teams, managers, and decision-makers with timely, structured information.

Core Functionality

What teams use to understand and manage operational activity:

- Real-time insight from PDF, Excel, CSV, and connected data sources
- Configurable reporting to reduce manual review and rework
- Integrated incident reporting with organisation-wide visibility
- Clear recommendations with measurable outcomes

Advanced Capabilities

Built for scale, complexity, and scrutiny:

- Predictive analytics for forecasting and scenario planning
- AI-assisted insight using current operational data
- Contextual forecasting using events, holidays, and local pressures
- API integration with external systems and trusted data sources

AMIS — INSIDE THE PORTAL

How insight, action, and monitoring come together in a single operational view

Real-Time Insight

Live dashboards give users immediate visibility of trends, hotspots, and emerging risks across the organisation. Activity can be explored by time, location, and incident category, helping teams understand what is happening now and where attention may be needed.

Connected Operational Intelligence

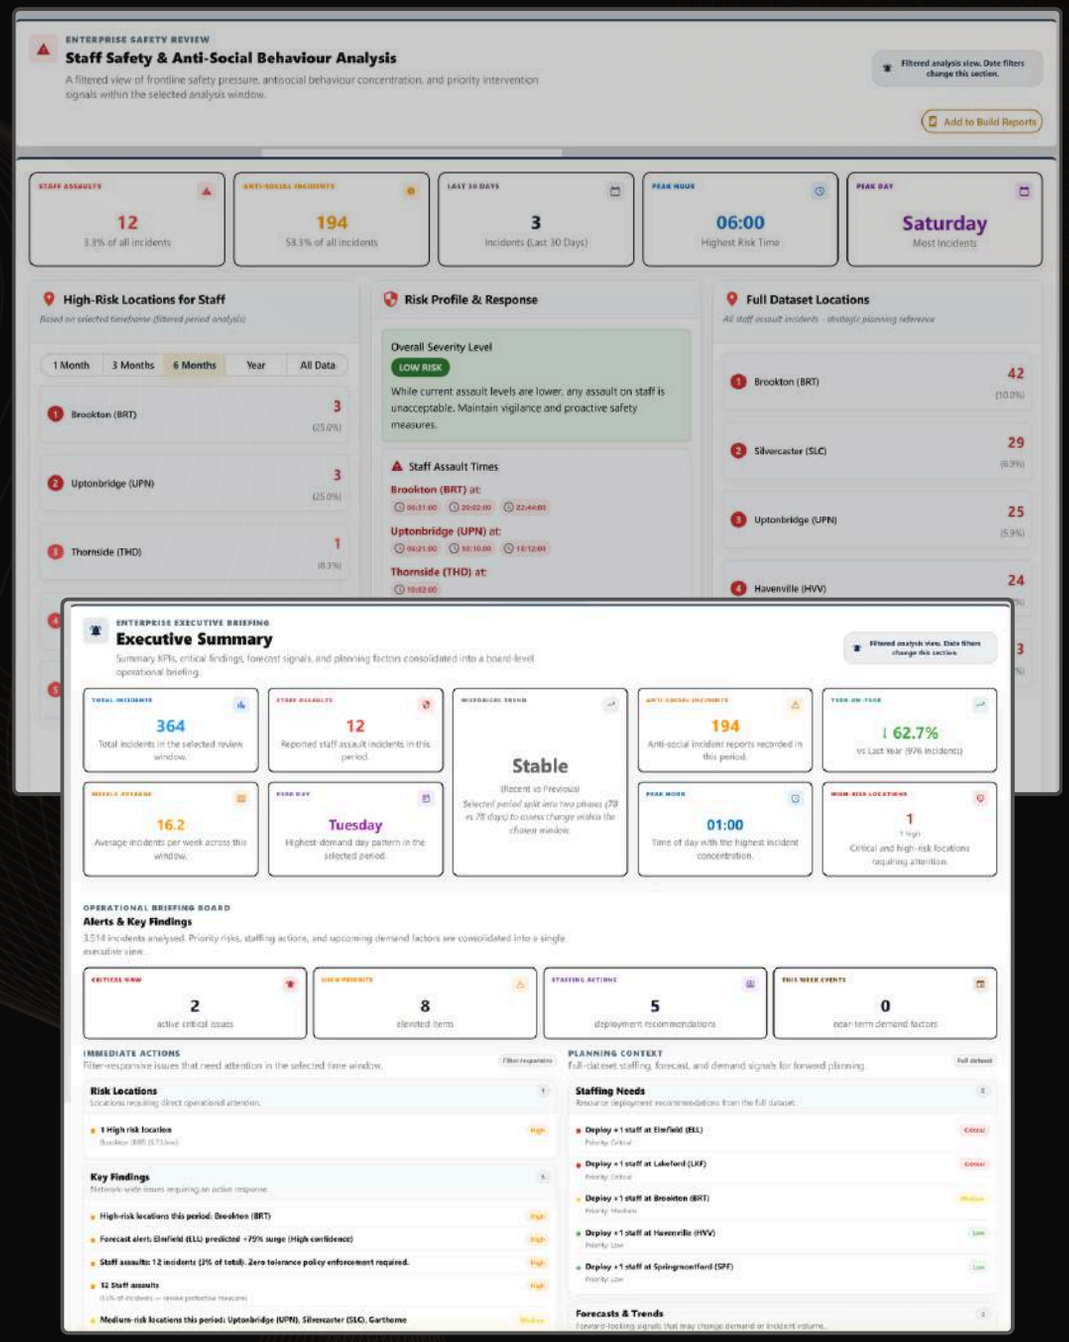

AMIS brings reporting, dashboards, analytics, and operational oversight together in one environment. This helps users work from current information while keeping a clear link between frontline activity, analysis, management review, and executive visibility.

Guided Action Planning

AMIS helps turn operational insight into clear, prioritised actions. Recommendations can be supported by rationale, expected outcomes, and performance indicators, helping teams act with confidence and accountability.

Ongoing Monitoring

Interactive dashboards help users track interventions and monitor how risk changes over time. This allows teams to measure outcomes, adjust responses, and maintain oversight as conditions develop.

REPORTING, DATA CAPTURE & OPERATIONAL WORKFLOW

Creating a consistent route from incident reporting to action

Operating Process

AMIS supports the way incidents, issues, and operational concerns are captured, reviewed, escalated, and acted upon. By standardising reporting and connecting each stage of the workflow, AMIS helps teams move from isolated records to a clearer, more accountable operating process.

Structured Reporting

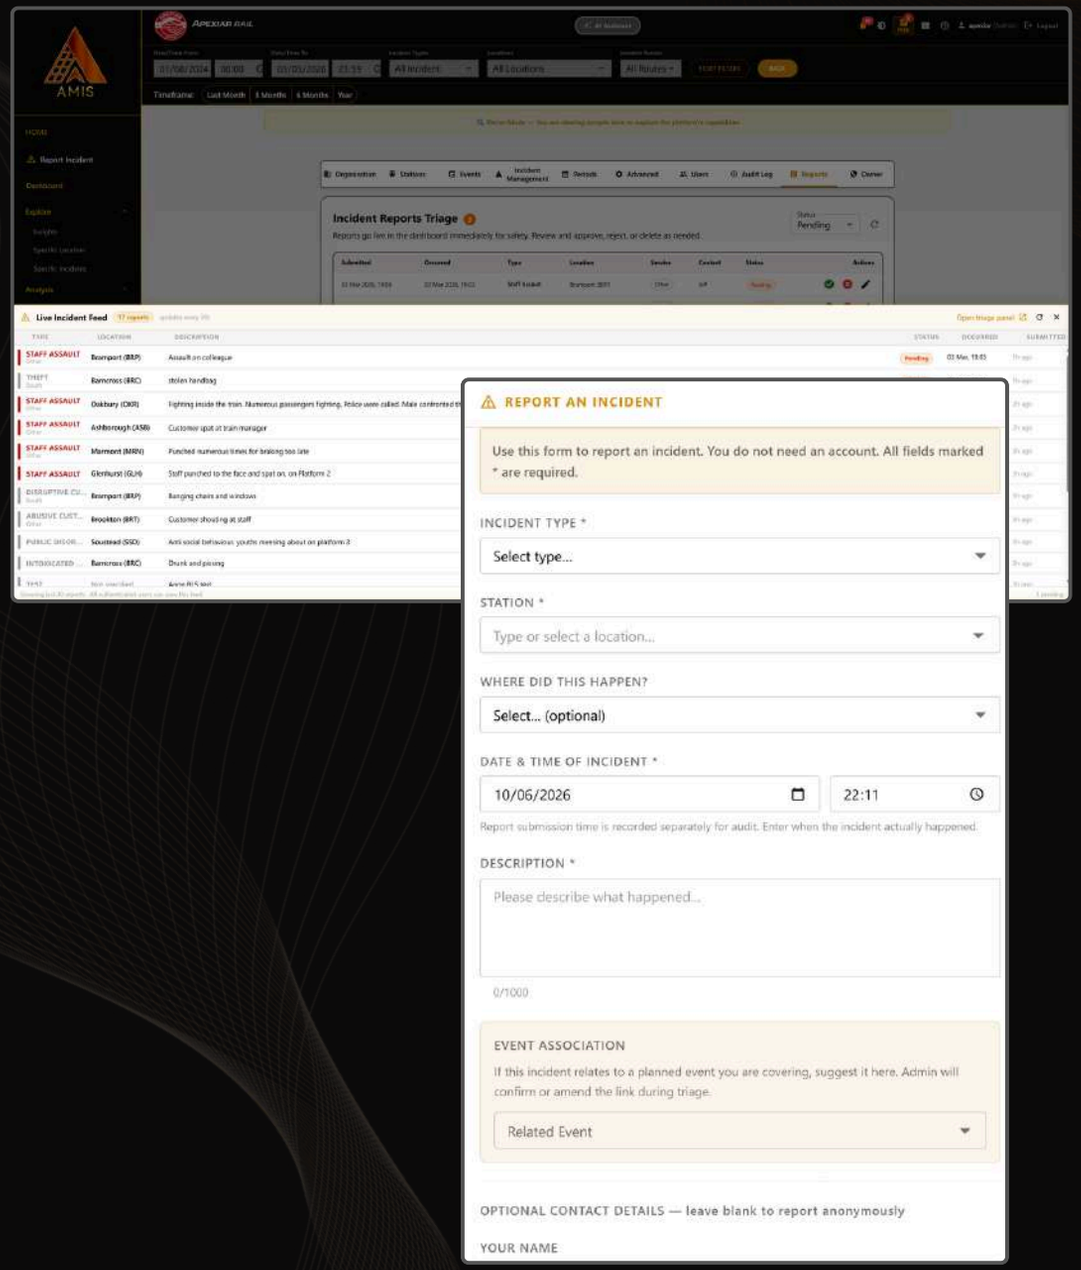

AMIS supports consistent data capture across incident types, locations, teams, services, and operational categories. This improves the quality of information available for review and reduces variation in how issues are recorded across the organisation.

Clear Review Process

Once information is captured, AMIS helps route it through the right review, escalation, and management process. This gives users clearer ownership and helps teams see what has been reviewed, what needs action, and what remains outstanding.

Traceable Action

Actions, decisions, updates, and outcomes can be linked back to the original report, creating a clear operational record. This strengthens accountability, supports audit readiness, and helps teams understand whether issues are being resolved effectively.

PREDICTIVE & PREVENTATIVE INTELLIGENCE

Identifying risk patterns before they become operational failures

Operational Foresight

AMIS helps teams move beyond looking back at incidents after they have happened. By using operational data, incident trends, and wider context, AMIS can help identify where risk may be increasing and where earlier action may be needed.

Pattern Detection

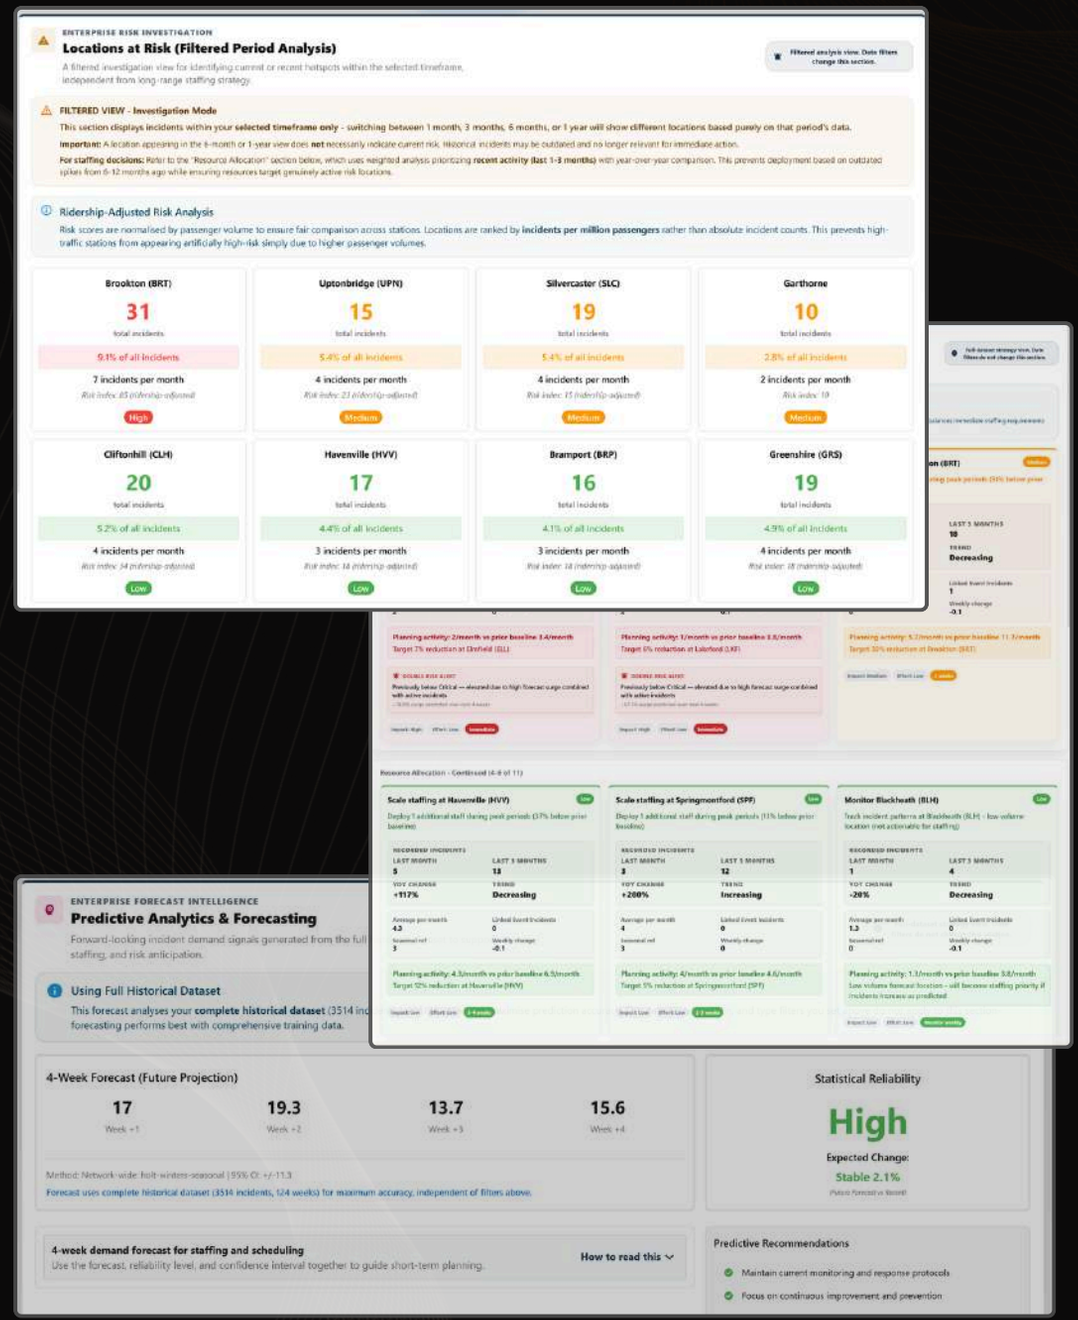

AMIS analyses activity across incident categories, locations, timeframes, teams, and recurring issue types. By identifying repeated patterns and changes in reporting behaviour, AMIS helps highlight areas where operational pressure may be building.

Predictive Risk Insight

Using historical and current data, AMIS supports forecasting of potential risk areas, escalation points, and future demand. This helps users anticipate where intervention may be needed before issues become more disruptive, costly, or difficult to manage.

Preventative Action Planning

AMIS helps turn predictive insight into targeted risk reduction plans, management review, and ongoing monitoring. Instead of only explaining what has already happened, AMIS helps teams prepare for what may happen next.

INTELLIGENT PLANNING & OPERATIONAL CONTEXT

Using operational context to support better decisions

Operational Value

AMIS helps teams understand not only what is happening, but why operational conditions may be changing. By combining incident intelligence with wider operational context, AMIS supports better planning, earlier intervention, and more confident oversight.

Context-Aware Planning

AMIS can factor in operational context such as seasonal demand, public holidays, school holidays, major events, location pressures, and recurring patterns. This helps users understand when risk may increase and where additional planning or resource review may be required.

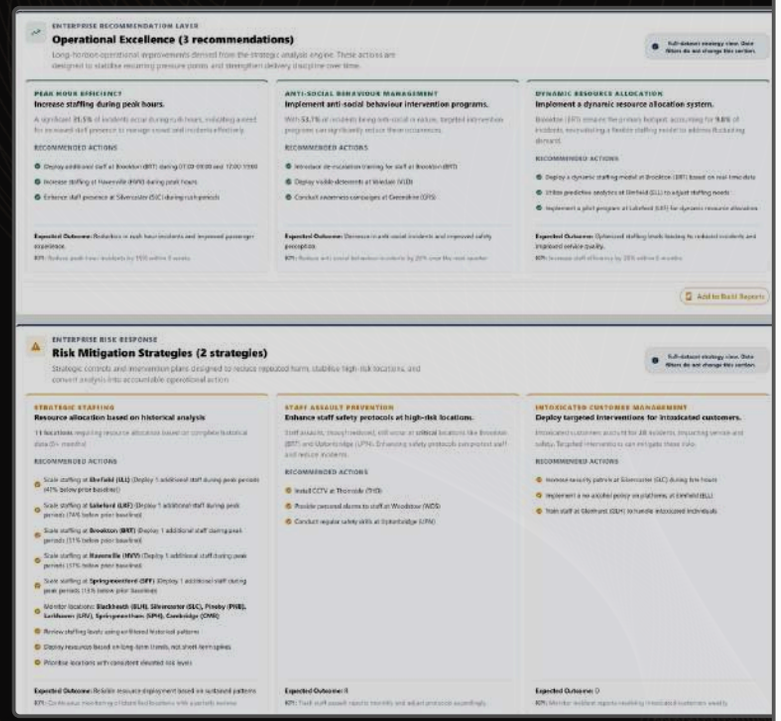

AI-Assisted Decision Support

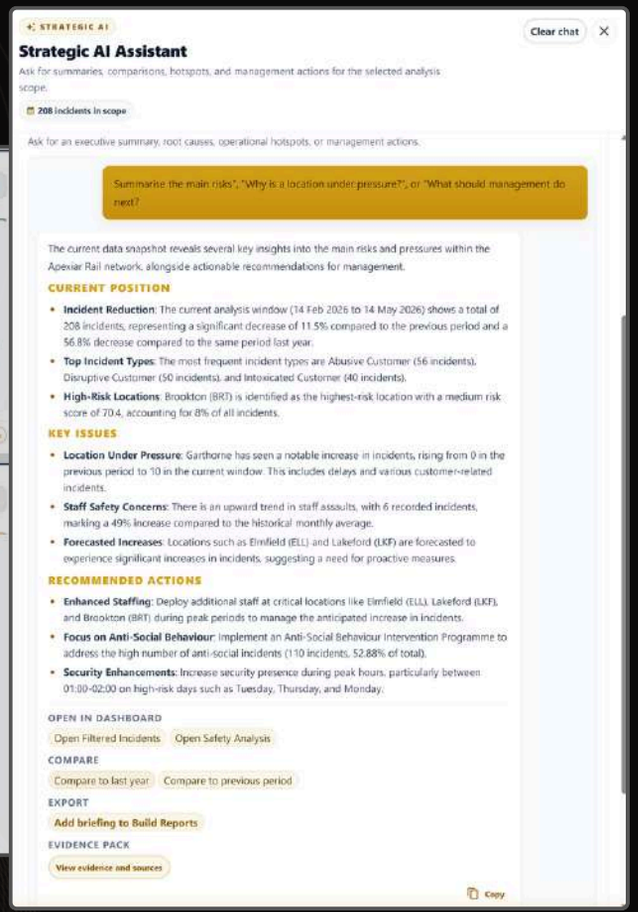

AMIS supports planning and review by helping interpret patterns, highlight pressure points, and identify areas for attention. This gives users and management teams a clearer basis for discussion, prioritisation, and operational decision-making.

Executive Value

By improving visibility, consistency, forecasting, and accountability, AMIS strengthens the quality of management information available across the organisation.

It supports better governance, more informed resource planning, reduced operational exposure, and earlier action on emerging risk.

APEXIAR

ARCHITECTS OF INTELLIGENT INFRASTRUCTURE

AMIS is designed for organisations operating in complex, high-risk and regulated environments where visibility, accountability, and well-informed decisions matter.

By combining continuous insight, structured analysis, and integrated reporting, AMIS turns fragmented operational data into a clear, trusted picture of performance, risk, and emerging issues.

This helps teams intervene earlier, reduce reliance on reactive decision-making, and build confidence that operational controls are working as intended and can stand up to scrutiny.

Built to scale.

Designed for governance.

Focused on operational certainty — with measurable impact.
