AXIS MAINTENANCE INTELLIGENCE PLATFORM

Operational Excellence through faster diagnosis, trusted evidence, and standardisation

Why AXIS ?

Inconsistencies in fault finding across shifts, inefficient fault finding, skilled technicians leaving the industry, unfamiliarity with the assets, poor or inaccurate repair notes - sound familiar ? Axis solves these challenges:

- Repeat faults consume time and engineering effort
- Knowledge is fragmented across shifts, teams, and documents
- Similar defects recur without clear historical visibility
- Diagnosis becomes difficult when evidence, trends, and repair history are disconnected
- All asset data in one unified platform.

How AXIS Transforms Decision Making

AXIS combines AI-powered diagnosis, asset data, repair guidance, and operational knowledge into a single decision environment, helping maintenance teams diagnose faults faster, improve consistency, and strengthen operational learning.

- AI-powered fault finding guides
- Machine learning continuously improves diagnosis outcomes
- Automated repair guidance provides recommended actions, schematics, traction notes, and safety bulletins
- Technicians access a complete suite of maintenance intelligence tools directly from a mobile device - on the job !
- Historical fault cases, repair outcomes, and operational evidence are instantly accessible

Who is AXIS for ?

AXIS for maintenance teams who looking to reduce cost, improve operational performance, whilst improving control of asset life cycles.

AXIS can be used with any assets that have maintenance history documented in data form, rolling stock teams, infrastructure managers, and production teams.

Typical uses include:

- Rolling stock assets
- Infrastructure assets such as axle counters, points and signalling systems
- Critical assets such as HVAC, Lifts, escalators, manufacturing lines.

AXIS is like having a team of your best engineers/technicians on shift, every second of every day

AXIS PORTAL

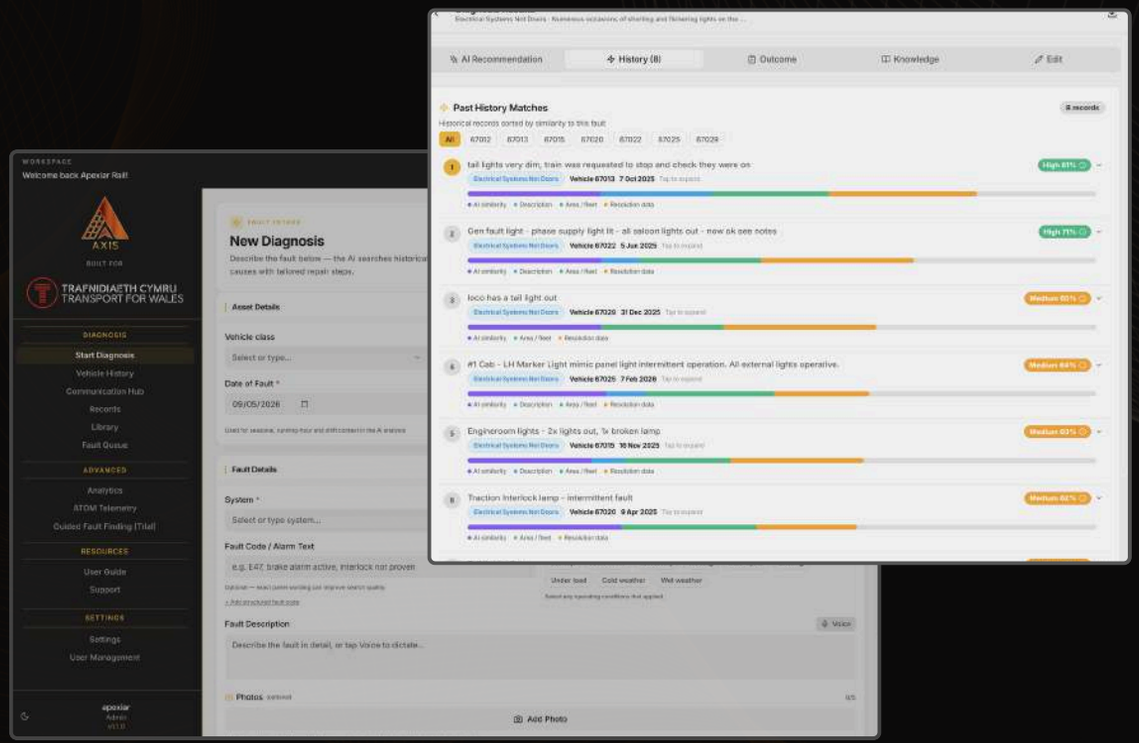

Rail Maintenance Intelligence to Improve Fleet Performance

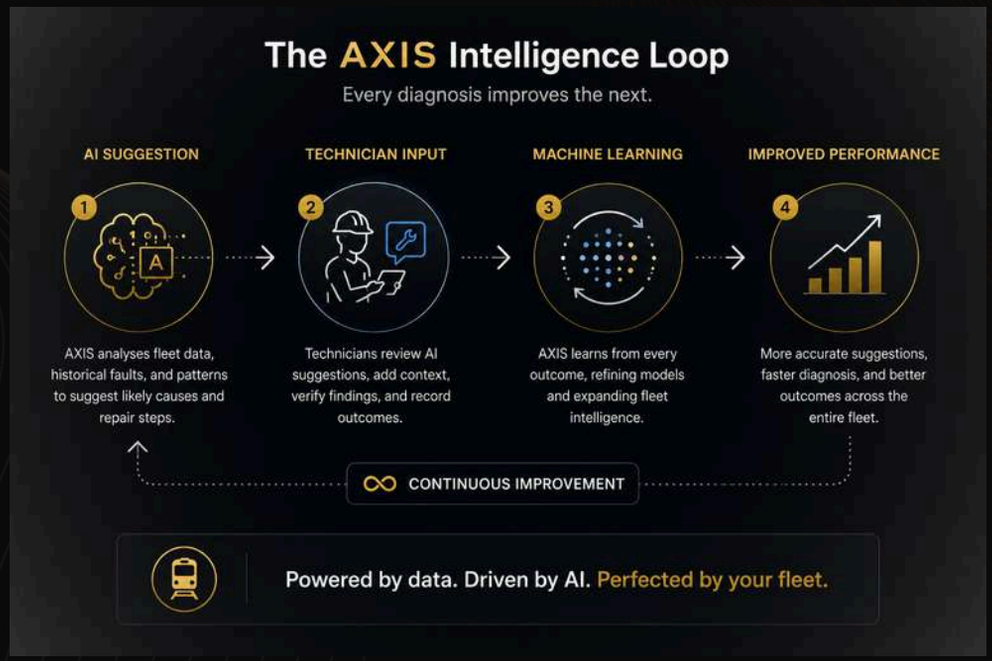

Overview

Maintenance teams need accurate fault diagnosis, trusted unit history, and clear fault rectification guidance and documentation

AXIS provides a unified platform for fault diagnosis, vehicle history, guided repair support, and fleet intelligence

Axis is built to be used on a desktop, or mobile device. Designed by engineers, developed for the frontline.

Advanced Capabilities

Built for scale, consistency, and operational excellence:

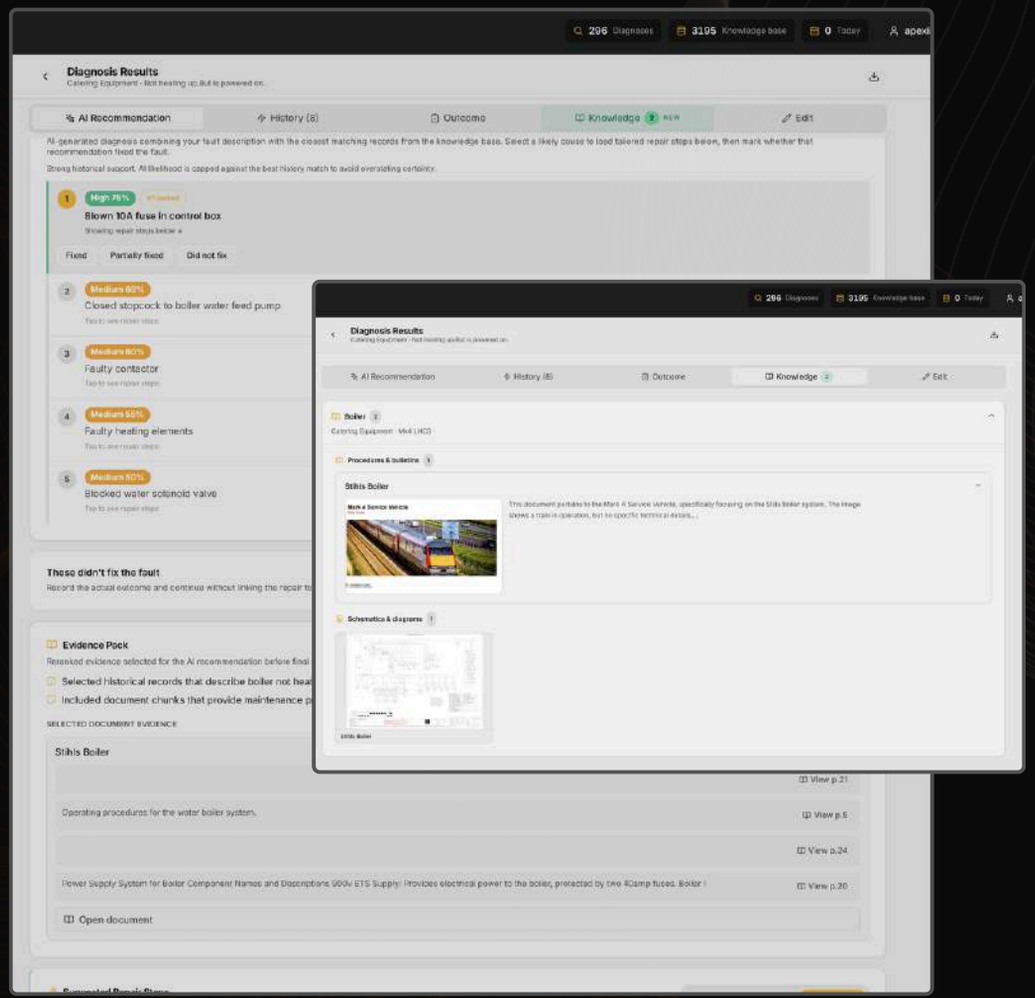

- Telemetry-informed investigation using live or recent vehicle data.
- Guided fault finding workflows aligned to approved repair practice
- Fault queue, communication hub, and shared diagnosis history
- Role-based access, scoped visibility, MFA support, and administration controls

AXIS — INSIDE THE PLATFORM

How diagnosis, evidence, repair action, and fleet learning connect

Supporting the Maintenance Decision Cycle

AXIS is designed to support the full maintenance decision cycle, from fault capture and diagnosis through to repair action, outcome recording, and ongoing fleet intelligence.

Fault Capture

Technicians capture the vehicle, system, symptom, severity, and supporting evidence at the point of diagnosis. This gives AXIS structured information to analyse and creates a clear record for traceability.

AI-Assisted Diagnosis

AXIS compares the submitted fault context with similar historical cases, vehicle history, and available evidence. It returns likely causes, confidence indicators, repair guidance, parts context, and links supporting documentation

Guided Repair Action

Repair recommendations are presented as practical next steps, helping technicians act consistently, while giving supervisors and engineers a clearer view of the evidence behind each decision.

Outcome Recording and Fleet Learning

Completed outcomes are recorded back into the shared knowledge base. Over time, this strengthens future diagnosis, improves visibility of recurring defects, and helps teams move from isolated troubleshooting to continuous fleet learning.

INTELLIGENCE BEGINS AT FAULT CAPTURE

Ensuring rail maintenance intelligence starts at the point of diagnosis

Structured data captured from source

Operational excellence begins with reliable, timely fault information.

AXIS captures vehicle, system, symptom, severity, technician notes, and supporting evidence at the point of diagnosis, ensuring fault data is structured, consistent, and ready for analysis.

By improving information quality at source, AXIS reduces ambiguity and creates a traceable link between frontline observations, repair action, and future fleet learning.

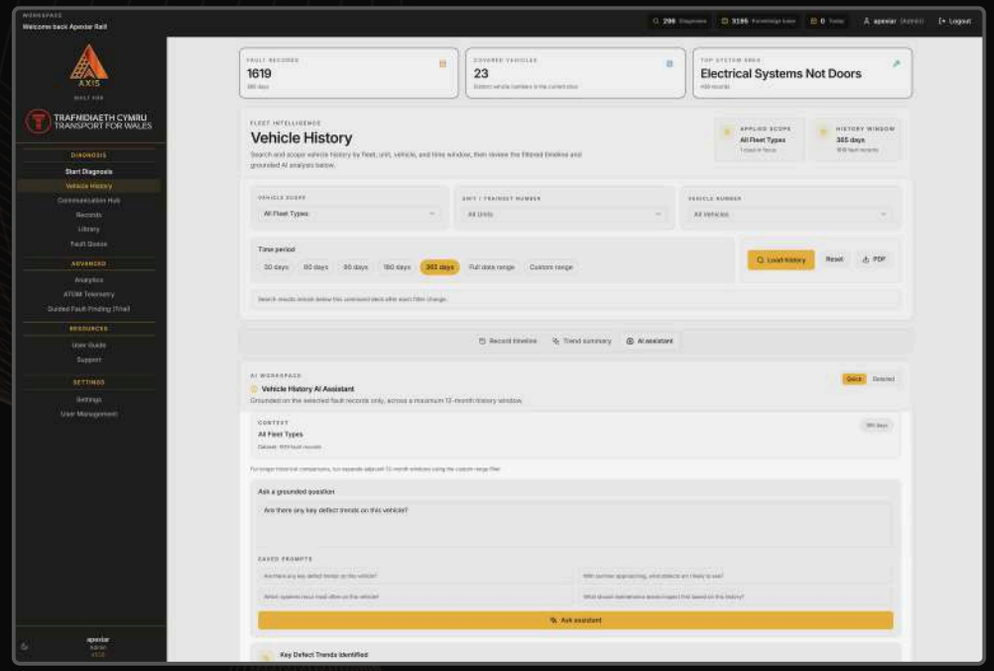

Improved data capture enables

- Faster comparison with similar historical faults
- Cleaner evidence for supervisors and engineers
- Stronger history for future fleet learning

Built for traceable maintenance reporting

- Structured vehicle, system, and symptom inputs
- Severity and operating context captured at source
- Optional photos and technician notes for supporting evidence
- Direct connection between diagnosis, outcome, and history
- Reusable data for fault matching and trend analysis

This establishes a stronger foundation for consistent, evidence-led maintenance decisions across teams and shifts.

VEHICLE HISTORY & FLEET INTELLIGENCE

Turn Historical Fault Data Into Operational Insight

Vehicle Level Visibility

AXIS gives teams instant visibility into recurring defects, repair outcomes, and vehicle behaviour across the fleet.

Teams can quickly see what happened previously, how similar faults were resolved, and whether patterns are reappearing.

AI-Assisted Vehicle Insight

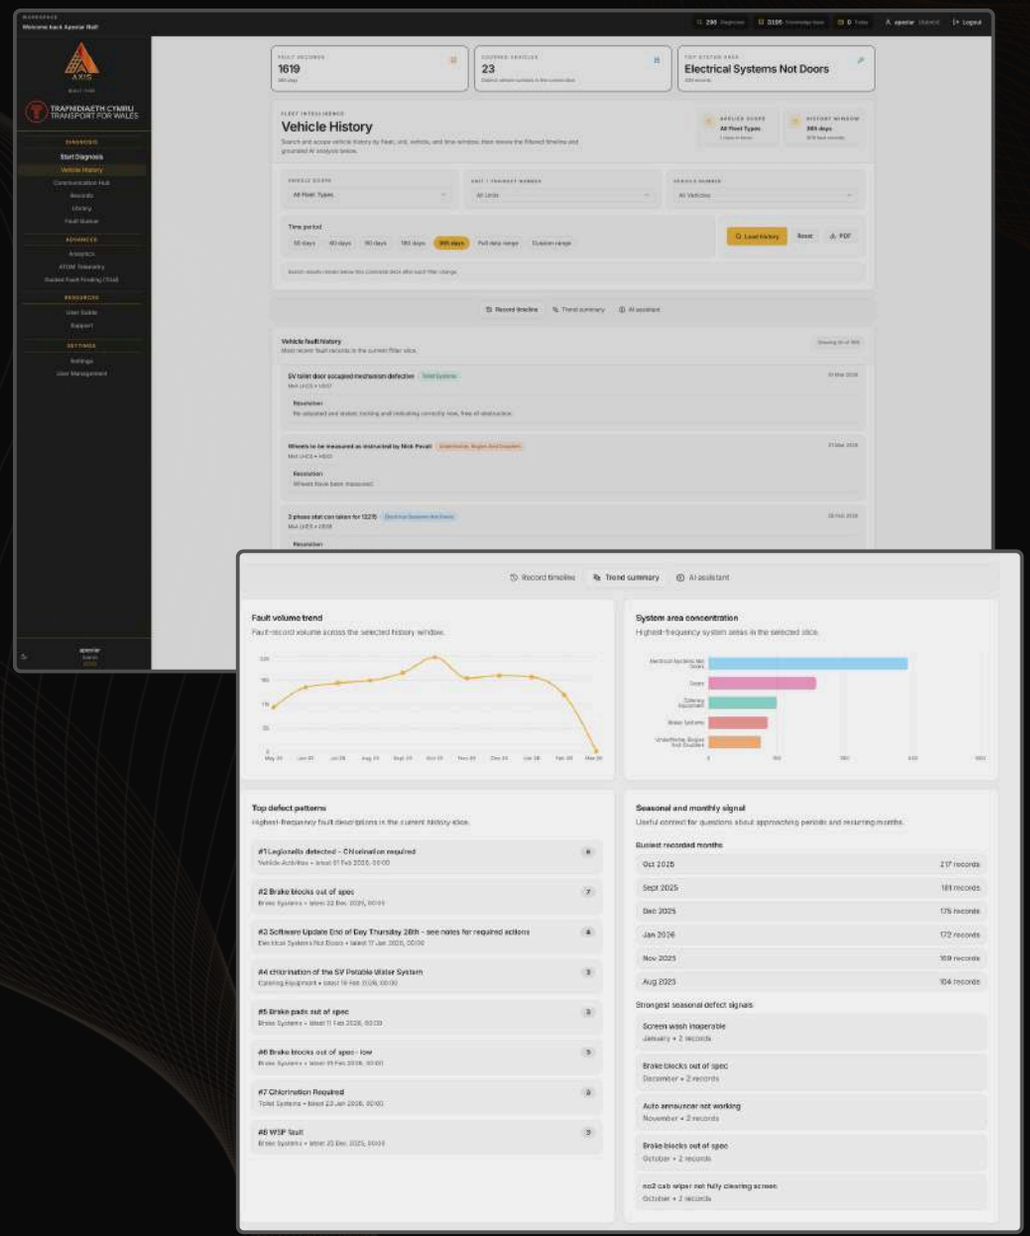

The AXIS vehicle history assistant helps teams interrogate selected vehicle records, time windows, and recurring fault patterns.

The powerful AI assistant engine can, forecast, predict and prevent vehcile defects before they happen.

Trend and Pattern Analysis

Maintenance intelligence is built from structured diagnosis history, outcomes, and recurring fault data.

- Review history by vehicle, system, and time period
- Identify repeated symptoms and common defect areas
- Compare recent activity against longer-term trends

AXIS — PREDICTIVE & PREVENTATIVE INTELLIGENCE

Moving from repeated fault investigation to earlier intervention

Recurring Defect Intelligence

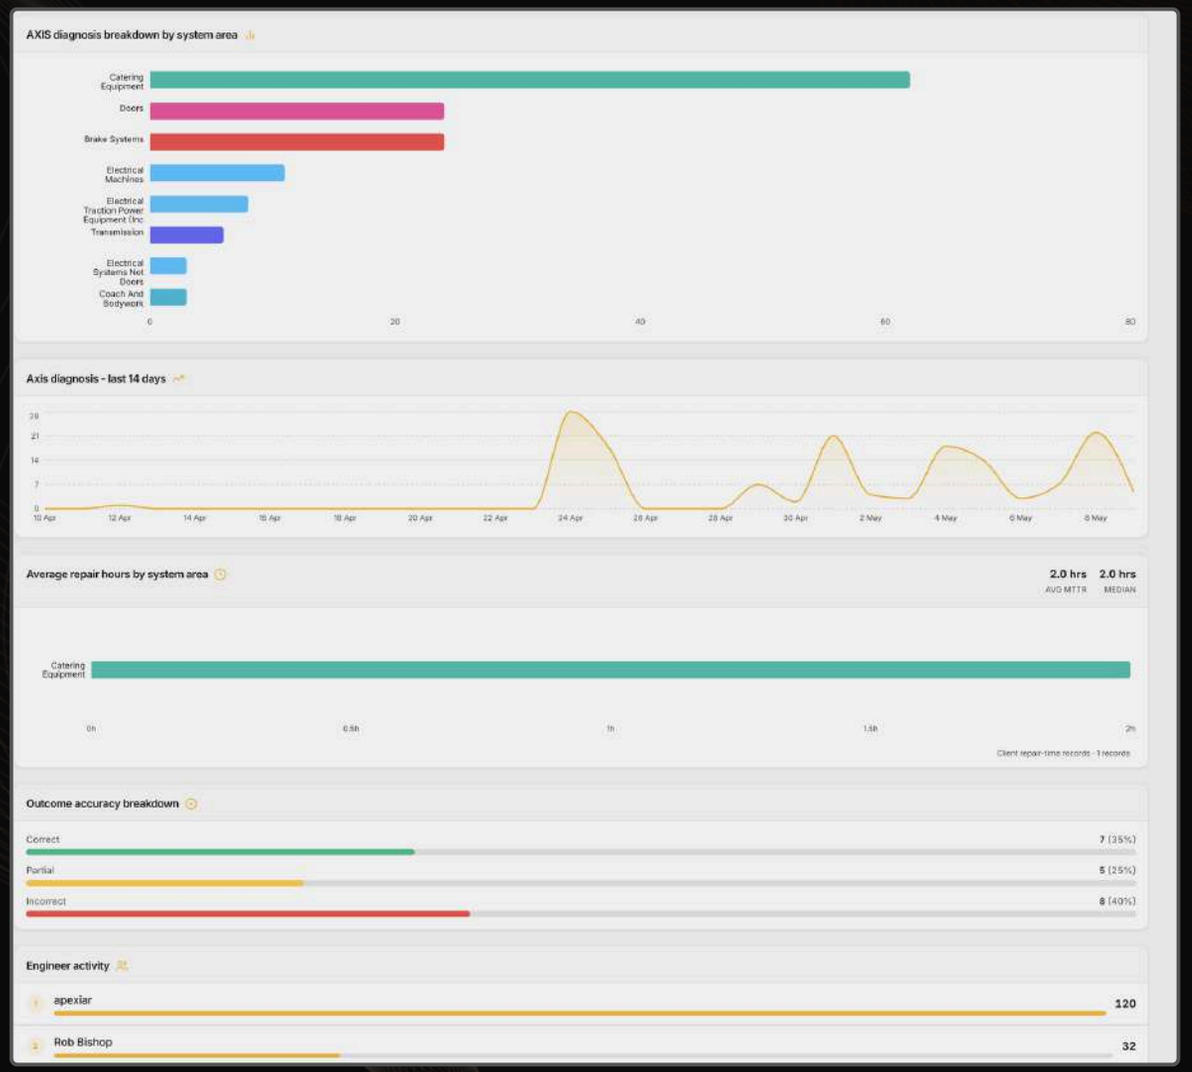

AXIS helps teams identify repeated symptoms, common system issues, and vehicle-level patterns that may not be obvious from isolated fault records.

Trend and Risk Analysis

By connecting diagnosis history, recorded outcomes, dashboard analytics, and operational context, AXIS gives supervisors and engineers a clearer view of where maintenance risk is building.

Safety Related Defects and Data Quality Insights

AXIS supports safety critical teams monitor trends and risk profiles. Work repair notes and analysed and bench marked against industry standard.

Without AXIS: Recurring defects are recognised late, after repeated investigation

With AXIS: Maintenance teams can identify patterns earlier and act with greater confidence

APEXIAR

ARCHITECTS OF INTELLIGENT INFRASTRUCTURE

AXIS is designed for maintenance environments where diagnosis accuracy, evidence quality, repeat-fault learning, and operational assurance matter.

By combining AI-assisted diagnosis, vehicle history, fleet analytics, guided repair knowledge, and enterprise controls, AXIS turns fragmented maintenance information into a clearer, more consistent operating model. This helps teams resolve faults faster, retain knowledge more effectively, and strengthen confidence across the fleet.

Built for fault diagnosis & data insights
Designed for improving operational performance.
Delivers Opperational excellence.
